Keyword one
Keyword two
Keyword three

ABSTRACT

[TODO: State the research problem and objective. Describe the method and the evidence used to evaluate it. Report only supported findings, with the relevant scope and uncertainty. End with the contribution and its limitations. Replace this entire placeholder with the abstract of the new manuscript.]

1. Introduction

[TODO: Explain the problem, why it matters, and the limitation in existing knowledge. State the research question and the contribution supported by this paper. Describe the organization if it helps the reader.]

2. Literature review

[TODO: Organize relevant studies by the scientific distinctions needed to understand the research gap. Verify each citation and explain the paper's position.]

Author–year citation examples: Author (2000) and (Author, 2000). Replace both the citation and its BibTeX entry.

3. Methodology

3.1. Problem statement

[TODO: Define the system, notation, decisions, assumptions, and research scope. Distinguish assumptions from consequences derived from the model.]

3.2. Model or method

[TODO: Describe the model, estimation, optimization, or analytical method in sufficient detail to reproduce it. Include only justified mathematical claims.]

4. Numerical experiments

4.1. Data and experimental settings

[TODO: Document data sources, scenarios, baselines, evaluation metrics, parameter settings, uncertainty, and reproducibility information. Adapt this section if the paper uses empirical analysis or theoretical examples instead.]

4.2. Results and interpretation

[TODO: Present the evidence for each claim. Separate observed results from explanations and generalizations. Discuss uncertainty and limitations.]

5. Conclusion

[TODO: Answer the research question using the supported findings. State the contribution, limits of applicability, and justified future work.]

*Corresponding author
first.author@example.com (F. Author); second.author@example.com (S. Author)

Acknowledgments

[TODO: Enter only funding identifiers and acknowledgments that apply to the new study. Remove this section if it is not applicable.]

A. Supporting material

[TODO: Place derivations, additional results, or reproducibility details here when they are needed. Remove unused appendices.]

B. Formatting examples (delete before submission)

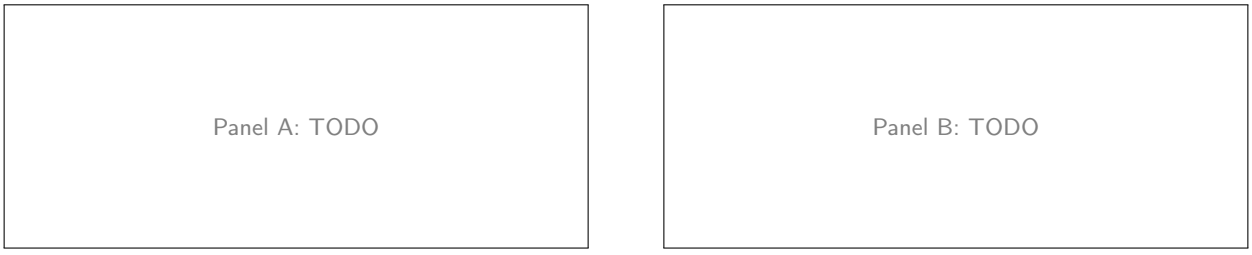
The following objects demonstrate formatting only. They do not state a model, an algorithm, or a numerical finding for the new study.

B.1. Equations and mathematical notation

$$y = f(\boldsymbol{x}; \boldsymbol{\theta}). \tag{1}$$

Equation (1) demonstrates left-aligned mathematics, bold symbols, and an equation reference. Replace the expression and define every symbol used in the actual study.

B.2. Figures and subfigures



(a) First panel. (b) Second panel.

Figure 1: Formatting example: two panels with a shared caption. Replace the boxes with the study's own figures, and explain the quantities and units.

Figure 1 illustrates the caption and reference style. Put new figure files in `figures/`.

B.3. Tables and notes

Table 1
Formatting example only; no numerical results are supplied.

Method	Metric A (unit)	Metric B (unit)
Baseline	—	—
Proposed method	—	—

Note: Dashes are placeholders, not zero measurements.

Table 1 uses the original table packages and style.

B.4. Algorithms

Algorithm 1 Formatting example only: replace with the actual procedure

Require: *TODO: specify the inputs*
Ensure: *TODO: specify the outputs*
1: *TODO: describe initialization*
2: *TODO: describe each step and any stopping rule*
3: **return** *TODO: specify the returned quantity*

Algorithm 1 demonstrates numbered pseudocode.
